

SITE LIFECYCLE MANAGEMENT

Keeping Pace in Today's Rapidly Changing Business Landscape

Keeping up with growth in the telecom and energy industries is becoming increasingly difficult, costly, and complex. The Internet of Things (IoT), 5G, small cell, renewable energy, and EV charging are examples of advanced infrastructure and technology that are driving business change and expansion. These innovations also drive large project volumes that require site managers to maintain tight control of operations, budgets, and associated assets.

Accruent Siterra is a leading enterprise-grade site lifecycle management solution that optimises the management of assets, projects, and leases for the telecommunications and energy industries. For over two decades, it has provided site managers, administrators, and owners with complete visibility of their organisation and greater agility by bringing all business processes and extended teams together in a single cloud solution.

Reduce operating costs while increasing efficiency by overseeing all project deliverables in one system.

Handle high volumes of site, asset, project, and lease artifacts in a single source of truth.

Track each stakeholder's role in critical paths and ensure they follow proper workflows to maximize accountability.

Customise user interface elements with local terminology and user-defined fields to align with your organisation's unique business operations and workflows

OPTIMISE PROJECTS & OPERATIONS WITH THESE STANDOUT CAPABILITIES

BULK OPERATIONS

Siterra's *Bulk Object Updater* allows users the ability to quickly perform bulk operations within the product's native user interface (UI). Performing bulk operations within the UI allows for a faster, more reliable way to affect data management in bulk while increasing end-user productivity. Administrators and advanced users with permission can also import lease payment, project, and asset data directly from external files.

GRANULAR PERMISSIONS CONTROL & USER PROVISIONING

Administrators can set up *Groups, Roles, and Permissions* to control which users have access to what data and analytics and which functions they can perform, thereby enhancing collaboration between all internal and external users, such as interdepartmental teams, contractors, vendors, and suppliers.

CASCADING OPERATIONS

The *Site Deactivation* capability offers a reliable and efficient way to deactivate all site assets and open projects. And for more granular and incremental control of the site deactivation process, users can invoke the *Project Cancellation* function.

"The scalable, agile site and project management provided by Siterra helps us to reach and serve new markets faster and more efficiently, facilitating our rapid growth and ensuring we continue to keep pace with ever-changing network needs in this evolving market."

— Telecom VP of Operations

TASK REJECTION WORKFLOW AUTOMATION

Establish workflows and dependencies between tasks with *Siterra's Schedule Templates*. Next, optimise an Approver's correction process by automatically re-opening all dependent tasks and subtasks when an Approver rejects a deliverable.

WORKDAY SCHEDULES

Configure multiple sets of workday and holiday definitions to align with country and other regional business policies. Siterra takes these settings into consideration when calculating project dates and durations.

SITE-BASED LICENSES

Siterra's license structure is based on the number of managed sites— not the number of users — giving your teams enhanced flexibility. Add as many users as needed per site without breaking the budget.
